

T2_FK

March 31, 2025

```
[152]: options(repr.plot.width=20, repr.plot.height=10) # Ajuste dos gráficos
options(warn=-1)
```

Instalando e carregando as bibliotecas utilizadas

```
[153]: library(pacman)
p_load(ggplot2, forecast, dlm, numDeriv, plotly)
```

Carregando as funções auxiliares, que não podem ser mostradas aqui ainda

```
[154]: source('funcoes_auxiliares.R')
```

0.1 Modelo MNL

Simulando o y conforme a minha função do Trabalho 1:

```
[155]: y_mnl <- simul_y_mnl(T=100, 10, 0.5, n_seed=1)
```

Utilizando o StructTS para estimar os hiperparâmetros via MLE:

```
[156]: fit <- StructTS(y_mnl, "level")
```

Sem usar a função de simulação

```
[157]: dados <- readRDS("dados.rds")
fit <- StructTS(dados$vetor1, "level")
```

Criando um dataframe com o tempo (1:T), a série simulada e o nível ajustado:

```
[158]: df <- data.frame(
  time = 1:length(y_mnl),
  observed = y_mnl,
  estimated_level = fitted(fit)[, "level"]
)
```

Utilizando o objeto 'fit', podemos extrair as estimativas para os hiperparâmetros:

```
[159]: # Extract estimated variances
sigma2_epsilon <- fit$coef["epsilon"]
sigma2_eta <- fit$coef["level"]
```

Podemos fazer o gráfico do nível estimado contra a série simulada utilizando o ggplot2

```
[160]: ggplot() +
geom_line(data=df,aes(y = observed,x = time, color = "Observed y_mnl"),
→linewidth = 1) +
geom_line(data=df,aes(y = estimated_level,x = time, color = "Estimated Level"),
→linewidth = 1) +
scale_color_manual(values = c("Observed y_mnl" = "black", "Estimated Level" =
→"red")) +
labs(
title = "Observed Data vs. Estimated Level",
x = "Time",
y = "Value",
color = "Legend"
) +

theme_minimal()+

theme(
  panel.grid.major = element_line(color = "gray", linewidth = 1),
  panel.grid.minor = element_line(color = "lightgray", linewidth = 0.5),
  axis.line = element_line(color = "black", linewidth = 1), # Make axis lines
→thicker and black
  axis.ticks = element_line(color = "black", linewidth = 0.8), # Make ticks
→more visible
  axis.text = element_text(size = 12, color = "black"), # Adjust axis text
→size and color
  axis.title = element_text(size = 14, color = "black") # Adjust axis title
→size and color
)
```

Recuperando o valor dos hyperparâmetros:

```
[161]: # Print estimated variances
cat("Estimated Observation Noise Variance (sigma^2_epsilon):", sigma2_epsilon, "\n")
cat("Estimated State Noise Variance (sigma^2_eta):", sigma2_eta, "\n")
```

Estimated Observation Noise Variance (sigma^2_epsilon): 7.7368

Estimated State Noise Variance (sigma^2_eta): 0.5600975

Será que o estimador MLE é consistente? Vamos aumentar o T e ver se as estimativas melhoram.

```
[162]: y_mnl <- simul_y_mnl(T=1000,10,0.5,1)
```

```
[163]: fit <- StructTS(y_mnl, "level")
```

```
[164]: df <- data.frame(
  time = 1:length(y_mnl),
  observed = y_mnl,
  estimated_level = fitted(fit)[, "level"]
)
```

```
[165]: sigma2_epsilon <- fit$coef["epsilon"]
sigma2_eta <- fit$coef["level"]
```

```
[166]: cat("Estimated Observation Noise Variance (sigma^2_epsilon):", sigma2_epsilon, "\n")
cat("Estimated State Noise Variance (sigma^2_eta):", sigma2_eta, "\n")
```

Estimated Observation Noise Variance (sigma^2_epsilon): 10.83406

Estimated State Noise Variance (sigma^2_eta): 0.6076557

Parece que com mais observações, as estimativas ficam mais próximas do valor verdadeiro.

No trabalho 1, conseguimos achar a sequência $a_t(1:T)$ e $F_t[1:T]$ a partir de um chute inicial para a_0 e p_0 .

Pergunta: será que se usarmos essa função do trabalho 2 utilizando as variâncias estimadas, conseguimos reproduzir a série do nível estimado?

Novamente:

```
[167]: y_mnl <- simul_y_mnl(T=1000,1,0.5,1)

fit <- StructTS(y_mnl, "level")
```

Utilizando a função da questão 2 do trabalho 1:

```
[168]: fitted<-mnl_fk(T=1000,y_mnl,fit$coef["epsilon"],fit$coef["level"],a0=fit$model0$a,p0=fit$model0
```

```
[169]: df_fitted_mnl <- data.frame(manual = fitted$a,structts=fit$fitted[, 'level'])
```

```
[170]: tail(df_fitted_mnl)
```

| | | manual <dbl> | structts <dbl> |
|---------------------|------|-----------------|-------------------|
| A data.frame: 6 × 2 | 995 | -12.96527 | -12.96527 |
| | 996 | -13.12028 | -13.12028 |
| | 997 | -13.11330 | -13.11330 |

| | 1000 | -13.17953 | -13.17953 |

```
[171]: head(df_fitted_mnl)
```

| | | manual <dbl> | structts <dbl> |
|---------------------|---|-----------------|-------------------|
| A data.frame: 6 × 2 | 1 | -0.6264538 | -0.6264538 |
| | 2 | 0.3378710 | 0.3378710 |
| | 3 | -0.1941920 | -0.1941920 |
| | 4 | 0.8891581 | 0.8891581 |
| | 5 | 0.7917861 | 0.7917861 |
| | 6 | -0.4389378 | -0.4389378 |

0.2 MTL

Definindo os parâmetros:

```
[172]: T <- 100
sigma2_epsilon <- 4
sigma2_eta <- 1
sigma2_qsi <- 0.1
n_seed <- 42
```

Simulando a série:

```
[173]: y_mtl <- simul_y_mtl(T, sigma2_eta=sigma2_eta, sigma2_qsi=sigma2_qsi,
  =>sigma2_epsilon=sigma2_epsilon, n_seed=n_seed)
```

estimando os hiperparâmetros usando MLE. Novo argumento: 'Trend'

```
[174]: fit_mtl <- StructTS(y_mtl, "trend")
```

Montando um dataframe com a séries:

```
[175]: df_mtl <- data.frame(
  time = 1:T,
  observed = y_mtl,
  adjusted_level = fit_mtl$fitted[, "level"],
  adjusted_trend = fit_mtl$fitted[, "slope"]
)
```

Fazendo os gráficos usando ggplot2:

```
[176]: ggplot() +
  geom_line(data=df_mtl,aes(x = time,y = observed, color = "Observed"), size = 1) +
  geom_line(data=df_mtl,aes(x = time,y = adjusted_level, color = "Adjusted Level"), size = 1,alpha=0.6) +
  scale_color_manual(values = c("Observed" = "black", "Adjusted Level" = "blue")) +
  labs(
    title = "Observed vs Adjusted Level StructTS (MTL)",
    x = "Time",
    y = "Value",
    color = "Legend"
  ) +
  theme_minimal()+
  theme(
    panel.grid.major = element_line(color = "gray", linewidth = 1),
    panel.grid.minor = element_line(color = "lightgray", linewidth = 0.5),
    axis.line = element_line(color = "black", linewidth = 1), # Make axis lines
    axis.ticks = element_line(color = "black", linewidth = 0.8), # Make ticks
    axis.text = element_text(size = 12, color = "black"), # Adjust axis text
    axis.title = element_text(size = 14, color = "black") # Adjust axis title
  )
```

```
[177]: ggplot() +
  geom_line(data=df_mtl,aes(x = time,y = adjusted_trend, color = "Adjusted_
→Trend"), size = 1) +
  scale_color_manual(values = c("Adjusted Trend" = "black")) +
  labs(
    title = "Trend using StructTS (MTL)",
    x = "Time",
    y = "Value",
    color = "Legend"
  ) +
  theme_minimal()+

  theme(
    panel.grid.major = element_line(color = "gray", linewidth = 1),
    panel.grid.minor = element_line(color = "lightgray", linewidth = 0.5),
    axis.line = element_line(color = "black", linewidth = 1), # Make axis lines_
→thicker and black
    axis.ticks = element_line(color = "black", linewidth = 0.8), # Make ticks_
→more visible
    axis.text = element_text(size = 12, color = "black"), # Adjust axis text_
→size and color
    axis.title = element_text(size = 14, color = "black") # Adjust axis title_
→size and color
  )
```

Don't know how to automatically pick scale for object of type `<ts>`. Defaulting to continuous.

Valores dos parâmetros:

```
[178]: cat("Estimated Observation Noise Variance (sigma^2_epsilon):",  
→fit_mtl$coef["epsilon"], "\n")  
cat("Estimated State Noise Variance (sigma^2_eta):", fit_mtl$coef["level"], "\n")  
cat("Estimated State Noise Variance (sigma^2_qsi):", fit_mtl$coef["slope"], "\n")
```

Estimated Observation Noise Variance (sigma^2_epsilon): 4.028132

Estimated State Noise Variance (sigma^2_eta): 1.495563

Estimated State Noise Variance (sigma^2_qsi): 0.003680569

Agora vamos fazer previsões e suavização:

```
[179]: y_mtl <- simul_y_mtl(T=100,10,0.1,1,n_seed=1)
```

Ajustando o modelo com StructTS

```
[180]: fit <- StructTS(y_mtl, type = "trend")
```

definindo o número de passos a frente:

```
[181]: h <- 20
```

Criando o objeto com as previsões:

```
[182]: forecast_obj <- forecast(fit, h = h, level = 90)
```

Fazendo a suavização

```
[183]: smoothed <- tsSmooth(fit)
```

Criando dataframe para o ggplot

```
[184]: df <- data.frame(  
  Tempo = 1:T,  
  Observado = y_mtl,  
  Suavizado = smoothed[, 1]  
)
```

```
[185]: df_pred <- data.frame(  
  Tempo = (T + 1):(T + h),  
  Previsao = forecast_obj$mean,  
  Lower = forecast_obj$lower[, 1],  
  Upper = forecast_obj$upper[, 1]  
)
```

```
[186]: ggplot() +  
  geom_line(data = df, aes(x = Tempo, y = Observado), color = "black", size = 1)  
→+  
  geom_line(data = df, aes(x = Tempo, y = Suavizado), color = "blue", size = 1) +  
  geom_line(data = df_pred, aes(x = Tempo, y = Previsao), color = "red", size =  
→1) +
```

```

geom_ribbon(data = df_pred, aes(x = Tempo, ymin = Lower, ymax = Upper), fill = "red", alpha = 0.2) +
labs(title = "Modelo de Nível Local: Observado, Suavizado e Previsão",
     x = "Tempo", y = "Valor") +
theme_minimal()+

theme(
  panel.grid.major = element_line(color = "gray", linewidth = 1),
  panel.grid.minor = element_line(color = "lightgray", linewidth = 0.5),
  axis.line = element_line(color = "black", linewidth = 1), # Make axis lines
  #thicker and black
  axis.ticks = element_line(color = "black", linewidth = 0.8), # Make ticks
  #more visible
  axis.text = element_text(size = 12, color = "black"), # Adjust axis text
  #size and color
  axis.title = element_text(size = 14, color = "black") # Adjust axis title
  #size and color
)

```

1 DLM

Como sempre fazemos :

```
[187]: T=100
```

```
[188]: y_mnl <- simul_y_mnl(T=T,10,0.5,1)
```

The function `dmlModPoly` in the `dml` package in R creates a state-space model for a polynomial

trend process. It helps define local level (MNL) and local trend (MTL) models by setting up the system matrices required for the Kalman filter.

```
[189]: build_mnl <- function(theta) {  
      dlmModPoly(order = 1, dV = theta[1], dW = theta[2])  
    }
```

estimando o modelo via MLE

```
[190]: fit <- dlmMLE(y_mnl, parm = c(100, 2), build_mnl, lower = rep(1e-4, 2))
```

parm: Initial values for the parameters to be estimated

lower: constraint in param values

Recuperando os valores estimados dos hiperparâmetros:

```
[191]: mod_mnl <- build_mnl(fit$par)  
      drop(V(mod_mnl))  
      drop(W(mod_mnl))
```

7.73678477296794

0.56010002101121

The inverse of the Hessian matrix of the negative loglikelihood function evaluated at the MLEs is, by standard maximum likelihood theory, an estimate of the asymptotic variance matrix of the maximum likelihood estimators

obtendo a hessiana avaliada no MLE

```
[192]: hs <- hessian(function(x) dlmLL(y_mnl, build_mnl(x)), fit$par)
```

Checando se é positiva definida

```
[193]: all(eigen(hs, only.values = TRUE)$values > 0)
```

TRUE

Calculando o Inverso da Hessiana

```
[194]: aVar <- solve(hs)
```

```
[195]: cat("Standard Error of dV:", sqrt(diag(aVar)[1]), "\n")  
      cat("Standard Error of dW:", sqrt(diag(aVar)[2]), "\n")
```

Standard Error of dV: 1.262764

Standard Error of dW: 0.3122962

Aplicando o filtro e suavização:

```
[196]: smooth_mnl <- dlmSmooth(y_mnl, mod_mnl)  
      filter_mnl <- dlmFilter(y_mnl, mod_mnl)
```

Extração dos estados suavizados

```
[197]: mu_hat <- drop(smooth_mnl$s)
```

Gerando as previsões com dlmForecast

```
[198]: fore_mnl <- dlmForecast(filter_mnl, nAhead = 10)
```

valores esperados para futuras obs

```
[199]: f <- fore_mnl$f
```

lista de variâncias de futuras observações

```
[200]: Q <- fore_mnl$Q
```

Calculando o intervalo preditivo (banda de 90%)

```
[201]: hwidth <- qnorm(0.95) * sqrt(unlist(Q))
```

Criando o intervalo de previsão

```
[202]: lower <- f - hwidth  
upper <- f + hwidth
```

Criar uma data frame para facilitar o uso no ggplot2

```
[203]: df_forecast <- data.frame(  
  Time = (length(y_mnl) + 1):(length(y_mnl) + 10),  
  Forecasted = f,  
  Lower = lower,  
  Upper = upper  
)
```

Criando o gráfico

```
[204]: ggplot(df_forecast, aes(x = Time)) +  
  # Adiciona as previsões como uma linha vermelha  
  geom_line(aes(y = Forecasted, color = "Forecasted"), size = 1) +  
  
  # Adiciona as bandas de previsão (intervalo de 50%)  
  geom_ribbon(aes(ymin = Lower, ymax = Upper), fill = "red", alpha = 0.3) +  
  
  # Adiciona as observações reais da série (y_mnl)  
  geom_line(data = data.frame(Time = 1:length(y_mnl), Observed = y_mnl),  
    aes(y = Observed, color = "Observed"), size = 1, linetype = "solid")  
→ +  
  
  # Adiciona a linha de suavização (suavizado)  
  geom_line(data = data.frame(Time = time(smooth_mnl$s), Smoothed =  
→ smooth_mnl$s),  
    aes(y = Smoothed, color = "Smoothed"), size = 1, linetype =  
→ "dashed") +
```

```

# Personalizando os eixos e título
labs(
  title = "Forecasted Values with Prediction Intervals",
  x = "Time",
  y = "Level",
  color = "Legend"
) +

# Customizando a paleta de cores
scale_color_manual(values = c("Forecasted" = "red", "Observed" = "black",
→ "Smoothed" = "blue")) +

# Tema minimalista
theme_minimal() +
  theme(
    panel.grid.major = element_line(color = "gray", linewidth = 1),
    panel.grid.minor = element_line(color = "lightgray", linewidth = 0.5),
    axis.line = element_line(color = "black", linewidth = 1), # Make axis lines
→ thicker and black
    axis.ticks = element_line(color = "black", linewidth = 0.8), # Make ticks
→ more visible
    axis.text = element_text(size = 12, color = "black"), # Adjust axis text
→ size and color
    axis.title = element_text(size = 14, color = "black"), # Adjust axis title
→ size and color
    legend.position = "top")

```

Análise dos resíduos

```
[205]: df_residual <- data.frame(resid = residuals(filter_mnl, sd =  
  FALSE), zero=rep(0,T), tempo<-seq(1:T))
```

```
[206]: ggplot() +  
  geom_line(data = df_residual, aes(x = tempo, y = resid), color = "black", size =  
    1) +  
  geom_line(data=df_residual, aes(x=tempo,y=zero))+  
  geom_point(data=df_residual,aes(x = tempo , y = resid), color = "black", size =  
    6 ,alpha=0.3) +  
  
  labs(title = "Modelo de Nivel Local: Erro de previsao",  
    x = "Tempo", y = "resid") +  
  theme_minimal()+  
  theme(panel.grid.major = element_line(color = "gray", linewidth = 1),  
    panel.grid.minor = element_line(color = "lightgray", linewidth = 0.5),  
    axis.line = element_line(color = "black", linewidth = 1), # Make axis lines  
    thicker and black  
    axis.ticks = element_line(color = "black", linewidth = 0.8), # Make ticks more  
    visible  
    axis.text = element_text(size = 12, color = "black"), # Adjust axis text size  
    and color  
    axis.title = element_text(size = 14, color = "black"))
```

testando se os resíduos são normais:

```
[207]: shapiro.test(df_residual$resid)
cat("media_residuos:", mean(df_residual$resid), '\n')
cat("var_residuos:", var(df_residual$resid), '\n')
```

Shapiro-Wilk normality test

```
data: df_residual$resid
W = 0.99154, p-value = 0.787
```

```
media_residuos: -0.02388998
var_residuos: 0.9994234
```

2 Implementando a MLE

o objetivo dessa secção é comparar a estimação manual e a minha implementação de estimação Gerando a série e fazendo a estimação usando pacote

```
[208]: T=1000
y_mnl <- simul_y_mnl(T=T,1,0.5,1)
fit <- dlmMLE(y_mnl, parm = c(100, 2), build_mnl, lower = rep(1e-4, 2))
```

Estimação manual

definindo o espaço paramétrico:

```
[209]: sigma_epsilon2_vals <- seq(0.1,4, length.out = 100)
sigma_eta2_vals <- seq(0.1, 4, length.out = 100)
```

função de verossimilhança:

```
[210]: logLik_mnl <- function(theta) {

  #definindo parâmetros
  sigma_epsilon2 <- theta[1]
  sigma_eta2 <- theta[2]

  # fazendo a filtragem usando minha função do trabalho 1
  fk_results <- mnl_fk(T = length(y_mnl), y_mnl, sigma_epsilon2, sigma_eta2, a0 = 0, p0 = 100)

  # extraindo (v_t) e a variância (F_t)
  v_t <- fk_results$v_t
  F_t <- fk_results$F

  # Computando a verossimilhança
  n <- length(y_mnl)
```

```

logLik <- - (n / 2) * log(2 * pi) - 0.5 * sum(log(abs(F_t))) - 0.5 *
→sum((v_t^2) / F_t)

return(logLik)
}

```

Calculando a verossimilhança para todas as combinações dos hiperparâmetros:

```
[211]: length(sigma_epsilon2_vals)
```

100

```
[212]: length(sigma_eta2_vals)
```

100

```
[107]: likelihood_matrix <- outer(sigma_epsilon2_vals, sigma_eta2_vals,
                                Vectorize(function(se, sw) logLik_mnl(c(se, sw))))
```

```
[108]: dim(likelihood_matrix)
```

1. 100 2. 100

transformando em um df para usar o ggplot2

```
[213]: expand.grid(c(1,2),c(10,20))
```

| | Var1 <dbl> | Var2 <dbl> |
|---------------------|---------------|---------------|
| A data.frame: 4 × 2 | 1 | 10 |
| | 2 | 10 |
| | 1 | 20 |
| | 2 | 20 |

```
[214]: likelihood_df <- expand.grid(sigma_epsilon2 = sigma_epsilon2_vals,
                                sigma_eta2 = sigma_eta2_vals)
```

adicionando a verossimilhança no df

```
[215]: likelihood_df$logLik <- as.vector(likelihood_matrix)
```

comparando os resultado

pacote:

```
[216]: cat("Estimated sigma^2_epsilon:", fit$par[1], "\n")
cat("Estimated sigma^2_eta:", fit$par[2], "\n")
```

Estimated sigma^2_epsilon: 1.074177

Estimated sigma^2_eta: 0.5647697

manual:

```
[217]: mle_estimates <- likelihood_df %>%
  filter(logLik == max(logLik)) %>%
  select(sigma_epsilon2, sigma_eta2, logLik)

names(mle_estimates)<-c("sigma2_epsilon", 'sigma2_eta', 'Max LogLikelihood')

cat("Estimated sigma^2_epsilon:", unlist(mle_estimates[1]), "\n")
cat("Estimated sigma^2_eta:", unlist(mle_estimates[2]), "\n")
```

Estimated sigma^2_epsilon: 1.084848
 Estimated sigma^2_eta: 0.5727273

```
[218]: fig <- plot_ly(
  x = unique(likelihood_df$sigma_epsilon2),
  y = unique(likelihood_df$sigma_eta2),
  z = likelihood_matrix,
  type = "surface",
  colorscale = "Inferno"
)

fig <- fig %>%
  layout(
    title = "Log-Likelihood Surface for MNL Model",
    scene = list(
      xaxis = list(title = expression(sigma[epsilon]^2)),
      yaxis = list(title = expression(sigma[eta]^2)),
      zaxis = list(title = "Log-Likelihood")
    )
  )

fig
```

HTML widgets cannot be represented in plain text (need html)

Heatmap:

```
[219]: ggplot(likelihood_df, aes(x = sigma_epsilon2, y = sigma_eta2, fill = logLik)) +
  geom_tile() +
  scale_fill_viridis_c()+
  labs(title = "Log-Likelihood Surface for MNL Model",
    x = 'sigma^2_epsilon',
    y = 'sigma^2_eta',
    fill = "Log-Likelihood") +
  theme_minimal()+
  theme(panel.grid.major = element_line(color = "gray", linewidth = 1),
    panel.grid.minor = element_line(color = "lightgray", linewidth = 0.5),
    axis.line = element_line(color = "black", linewidth = 1), # Make axis lines
    ↪thicker and black
```

```
axis.ticks = element_line(color = "black", linewidth = 0.8), # Make ticks
→more visible
axis.text = element_text(size = 12, color = "black"), # Adjust axis text
→size and color
axis.title = element_text(size = 14, color = "black"))
```

3 exercícios

- 1) estime o modelo de nível Local utilizando a base de dados Nile (usando StructTS e DLM) e faça o gráficos usando ggplot2.

Usando o structTS

```
[220]: fitNile <- StructTS(Nile, "level")
```

```
[221]: df <- data.frame(Nile_obs <- Nile, time=seq(1:
→length(fitNile$fitted)), estimated_level<-fitted(fitNile), smoothed<-tsSmooth(fitNile))
```

```
[222]: h=10
```

```
[223]: forecast_obj <- forecast(fitNile, h = h, level = 90)
```

```
[224]: T=length(fitNile$fitted)
```

```
[225]: df_pred<-data.
